# Icinga

<https://icinga.com/>

Icinga monitors availability and performance, gives you simple access to relevant data and raises alerts to keep you in the loop.

Snippet from [Wikipedia](#): **Icinga**

**Icinga** is an open-source computer system and network monitoring application. It was created as a fork of the Nagios system monitoring application in 2009.

Icinga tries to improve Nagios's development process as well as adding new features such as a modern Web 2.0 style user interface, additional database connectors (for MySQL, Oracle, and PostgreSQL), and a REST API that lets administrators integrate numerous extensions without complicated modification of the Icinga core.

The first stable version, 1.0, was released in December 2009, and new versions were released every couple of months as of January 2010.
